Topic A: Basic Parent Functions and Transformations

Directions: For each function family, give the parent function and sketch the shape of the graph.

Linear $f(x) = x$ 	Absolute Value $f(x) = x $ 	Quadratic $f(x) = x^2$ 	Cubic $f(x) = x^3$ 
Square Root $f(x) = \sqrt{x}$ 	Cube Root $f(x) = \sqrt[3]{x}$ 	Reciprocal $f(x) = \frac{1}{x}$ 	Greatest Integer $f(x) = \lfloor x \rfloor$ 

Recall the following transformations rules given a function $f(x)$:

Translations (Shifts)	Reflections	Dilations (compress/stretch)
$f(x + h)$ shifts left	$-f(x)$ reflects over the x -axis	$a \cdot f(x)$ is a vertical compression when $ a < 1$ and a vertical stretch when $ a > 1$
$f(x - h)$ shifts right		
$f(x) + k$ shifts up	$f(-x)$ reflects over the y -axis	$f(b \cdot x)$ is a horizontal stretch when $ b < 1$ and a horizontal compression when $ b > 1$
$f(x) - k$ shifts down		

Directions: Describe the transformations from the parent function.

1. $f(x) = -\frac{5}{x+7} - 2$ - Reflect in x-axis - Vert. Stretch by 5 - Trans. left 7, down 2	2. $f(x) = \sqrt[3]{-2(x-1)} + 5$ - Reflect in y-axis - Horiz. compress by $\frac{1}{2}$ - Trans. right 1, up 5	3. $f(x) = -\left[\frac{x+4}{3}\right] + 1$ - Reflect in x-axis - Horiz. stretch by 3 - Trans. left 4, up 1
4. The absolute value parent function is reflected in the x-axis, horizontally stretched by a factor of 3, and translated 5 units right. Write an equation to represent the new function. $f(x) = -\left \frac{1}{3}(x-5)\right $	5. The greatest integer parent function is vertically compressed by a factor of $\frac{1}{4}$, then translated 1 unit left and 7 units up. Write an equation to represent the new function. $f(x) = \frac{1}{4} \lfloor x+1 \rfloor + 7$	

6. Transformations were applied to the square root parent function such that it creates an endpoint at (3, 8). If the domain of the function is given by $(-\infty, 3]$, write an equation that could represent this new function. $f(x) = \sqrt{-(x-3)} + 8$	7. A certain function is vertically compressed by a factor of $\frac{1}{2}$, horizontally stretched by a factor of 2, and translated left 6. If the new function is represented by $f(x) = 3(x+7)^3 - 4$, write an equation that could represent the original function. $f(x) = 6(2(x+1))^3 - 4$		
Directions: Using the description of transformations from the parent function, (a) write a function, then (b) graph the function and state its domain and range.			
8. The quadratic function is reflected in the x-axis, vertically stretched by a factor of 3, translated left 4 and up 6.	9. The square root function is vertically stretched by a factor of 5, horizontally stretched by a factor of 2, then translated left 2 and down 8.		
a. $f(x) = -3(x+4)^2 + 6$	a. $f(x) = 5\sqrt{\frac{1}{2}(x+2)} - 8$		
b. 	Domain: $\mathbb{R}$ Range: $\{y y \leq 6\}$	b. 	Domain: $\{x x \geq -2\}$ Range: $\{y y \geq -8\}$
